PROFESSIONAL SUMMARY

Business Analyst with 2+ years of experience managing requirements for supply chain, procurement, and logistics systems — from stakeholder discussions and gap analysis through BRD/FRD documentation and UAT. Worked directly with commodity managers, buyers, supply planning teams, logistics coordinators, and product owners to translate business problems into clear, validated requirements for development. Delivered 8+ products from requirement to live deployment across procurement automation, freight intelligence, supply visibility, and SaaS platform domains, consistently reducing manual effort and improving process turnaround time.

CORE COMPETENCIES

Business Analysis: Requirement Gathering, BRD/FRD Preparation, Gap Analysis (As-Is/To-Be), User Stories, Process Analysis, UAT Coordination, Defect Tracking, Stakeholder Management, Agile/Scrum

Supply Chain & Logistics: RFQ Management, Freight Sourcing & Comparison, Procurement Process Analysis, Supply & Demand Planning, Supplier OTD & Risk Analysis, Inventory Management, Shortage Analysis, Inbound/Outbound Logistics Tracking, eProcurement

Technical Stack: SQL, Python, SAP (data consumption), API Integration, JIRA, Tableau, Lucidchart

PROFESSIONAL EXPERIENCE

Business Analyst | InESS Global Solutions, Chennai

2024 – Present

- Led requirement-gathering discussions with commodity managers, buyers, logistics coordinators, product owners, and supply planning stakeholders at client organisations to understand existing workflows, documenting findings as BRDs/FRDs and user stories for the development team.
- Performed gap analysis comparing existing manual procurement, freight, and supply chain workflows against proposed system designs, identifying pain points and documenting target-state requirements across multiple live products.
- Monitored post-launch issues and change requests raised by users, collaborating with stakeholders and developers to prioritise and resolve them.
- Coordinated UAT with end users across multiple product launches, tracking defects, aligning with engineering on fixes, and confirming requirements were met before go-live.
- Partnered with the team to define validation checks on system outputs, keeping results aligned with business and compliance expectations.

Career Break | Family Caregiving Responsibility

2020 – 2023

- Managed family caregiving responsibilities. Concurrently built foundational analytical and technical skills (Python, data fundamentals) in preparation for re-entry.

Junior Associate — QA & Testing | Amazon, Chennai

2019

- Executed end-to-end functional and UI testing for the Amazon Audible platform across web and mobile surfaces, covering regression, smoke, and exploratory test cycles.
- Identified and documented defects against product requirements, contributing to zero P0 bugs at global launch.
- Built a reusable test case library based on product requirements, reducing future regression cycle time.

KEY PROJECTS

Spares Automation Tool — Arista Networks (client engagement)

Stakeholders: Commodity managers and procurement leads at Arista Networks.

- Conducted requirement-gathering sessions with procurement stakeholders to understand existing manual spares sourcing and RFQ processes; performed gap analysis identifying that validation, approval, and quote comparison steps were handled manually across three separate procurement modules with no standardised rules.

- Documented functional requirements and validation logic for each module into a BRD/FRD, covering rule-based processing, exception handling, and approval workflows for engineering handoff.
 - Coordinated UAT with procurement end users across all three modules, tracked defects, aligned with engineering on fixes, and signed off before go-live.
 - Outcome: 40% reduction in turnaround time, zero manual processing errors since go-live; replaced a fragmented, error-prone manual process with a fully automated, rules-driven system.
-

SaaS Platform — Centralised Tool Access & Subscription System — InESS Solutions

Stakeholders: *InESS Directors, Operations Managers, and Engineering team.*

- Identified through analysis of existing tools that products like ProcurePilot and FreightPilot were being built in isolation with no common platform for users to discover, subscribe, or access — and led requirement-gathering sessions with internal stakeholders to define the full platform scope.
 - Translated stakeholder needs into structured user stories and workflows covering the entire user journey from sign-up to tool access, including subscription flow (plan selection, payment, role-based access, and upgrade paths) to enable full self-service without admin intervention.
 - Defined requirements for the admin layer covering user management, plan limits, subscription tracking, and usage reporting, giving organisations full visibility and control over their accounts.
 - Documented requirements for a Settings module (branding, notifications, compliance, support) to support multi-organisation customisation on a single platform.
 - Ran structured UAT across all modules with internal teams, tracked defects, coordinated fixes with engineering, and signed off before go-live.
 - Outcome: Delivered a scalable foundation platform acting as the single commercial and access layer for all current and future tools, replacing a fragmented, manually managed process with one self-serve product.
-

Support Ticketing Module — ProcurePilot SaaS RFQ Platform — InESS Solutions

Stakeholders: *InESS Operations Managers, Support leads, and Engineering team.*

- Authored the FRD for a multi-tenant support ticketing module, covering role definitions, an access control matrix, and ticket field specifications to ensure each tenant's data remained fully isolated.
 - Defined priority and SLA rules (Critical to Low, with response and resolution targets) and documented the full ticket status lifecycle (Open → In Progress → Resolved → Closed → Reopened) for both development and QA reference.
 - Documented key business rules and edge cases — including duplicate ticket handling, cross-tenant access restrictions, and SLA override conditions — to reduce ambiguity during development.
 - Covered core non-functional requirements around security (tenant data isolation), performance, and scalability.
 - Outcome: Module built and deployed into the live SaaS platform, giving users a structured, role-appropriate way to raise and track support issues tied to RFQ activity.
-

FreightPilot — Logistics & Freight Intelligence Platform — InESS Solutions

Stakeholders: *InESS Operations Managers, Logistics domain experts, and Engineering team.*

- Analysed existing freight sourcing practices and available tools; identified that part numbers, packaging data, and supplier quotes were scattered across PDFs, emails, and spreadsheets with no single source of truth — causing slow RFQ turnaround and inconsistent freight decisions.
 - Gathered requirements from internal stakeholders to document workflows for RFQ creation, a supplier quote comparison engine (covering ocean/air rates, guaranteed capacity, and customs brokerage costs), and a real-time inbound/outbound Logistics Tracker.
 - Coordinated UAT with internal teams before go-live.
 - Outcome: Replaced manual freight comparisons with a self-serve module, giving teams a single tool to raise, compare, and track freight requests end to end.
-

Live Tool Maintenance & Continuous Improvement — Arista Networks

- Support live tools post-launch — logging and following up on change requests, refining business rules based on user feedback, and assisting commodity managers with quote analysis.
- Conduct tariff analysis to support commodity managers in evaluating sourcing decisions; review and verify claim documentation submitted by Contract Manufacturers, approving submissions where requirements are met and escalating discrepancies for resolution.

EDUCATION

B.E. in Mechatronics Engineering — SNS College of Technology, Coimbatore

2017
